

# ftp server documentation

Irene Keller, 29.3.18

ftp server: binfftp01.unibe.ch

Rémy needs to set up an account for each new user. He will then send you the username and password. With this information, people can use FileZilla (Windows) or fetch (Mac) to download their data.

To transfer files from the command line:

The first time you do this, set up a file ~/.netrc which contains the line below. **Make sure only you have read-access to this file!**

```
machine binfftp01.unibe.ch login <myusername> password <mypassword>
```

## Upload

```
curl --ftp-ssl --tlsv1.2 --insecure --netrc -T <localFileToUpload>  
ftp://binfftp01.unibe.ch/<pathToDirectoryOnFtpServer>/
```

Multiple files can be specified for -T argument like this:

```
-T "{file1,file2}"
```

## Download

```
curl --ftp-ssl --tlsv1.2 --netrc --insecure -o  
<nameForLocalFile> ftp://binfftp01.unibe.ch/<pathToFileOnFtpServer>
```
